

Identify Meteorological Tsunamis Along the U.S. East Coast

Advisor: Dr. Cheng Zhang

- Sudden changes in atmospheric pressure (Figures a & b), moving at high speeds, can generate significant tsunamis (Figures c).
- This clinic team will collect oceanic and meteorological data from NOAA tide stations and identify meteorological tsunamis (MTs) that have occurred along the U.S. East Coast since 2018.
- One selected significant event will be investigated using numerical modeling.
- This project will be supported by National Oceanic and Atmospheric Administration (NOAA)
