

Evaluate the Vulnerability of WWTPs in Southern New Jersey

Dr. Cheng Zhang and Dr. Kauser Jahan

- Coastal wastewater treatment plants in Southern New Jersey face compound flood risk from hurricanes.
- This project uses publicly available data and simple Python analysis to quantify historical storm impacts on WWTPs in South New Jersey.
- This clinic team will collect storm surge data from significant historical hurricanes in the region, identify coastal WWTPs at risk, and assess their future compound flooding risk using return-period-based indicators.
- This project funded by New Jersey Water Resources Research Institute (NJWRRI).

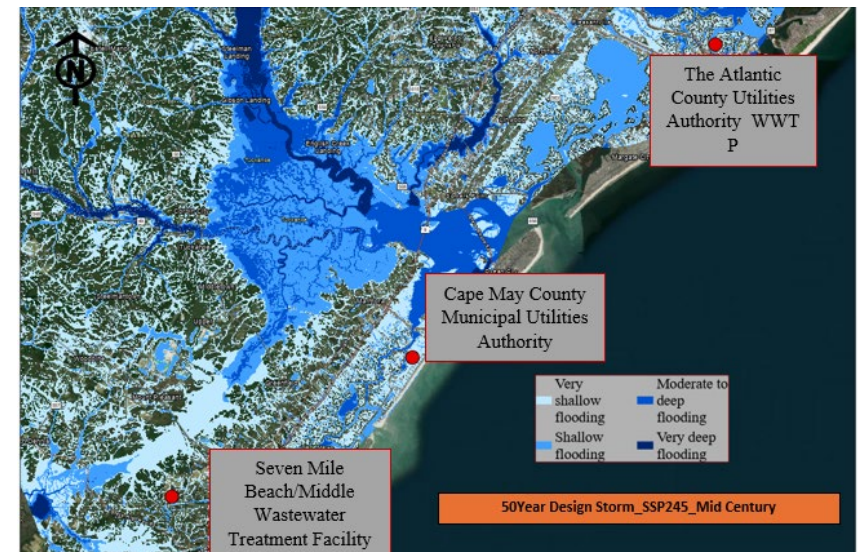

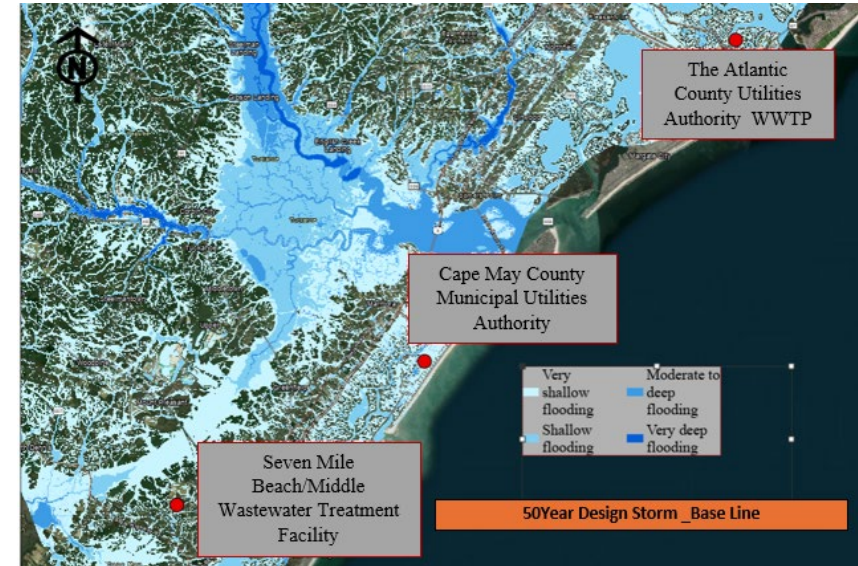

Figure: Future 50-year storms under climate change produce greater flood depth and extent than the baseline, causing more widespread shallow flooding around the WWTP locations
