

Effectiveness of Asphalt Interlayer as a Bond Breaker in PCC Overlays

Our goal is to understand how the underlying PCC condition and asphalt interlayer affect the load response of a PCC overlay. *(2 CEE Clinic Students)*

Advisors: Dr. Yusuf Mehta and Dr. Abhary Eleyedath

Over the next semester, we will:

1. Evaluate load transfer across joints in the underlying PCC.
2. Examine how underlying PCC condition affects load transfer and overlay response.
3. Evaluate the effect of the asphalt interlayer (bond breaker) on pavement response.
4. Distinguish whether changes in pavement response are associated with the underlying PCC or the interlayer

The National Airport Pavement Test Vehicle
